**Title: Unlocking Confidence: The Power of Follicular Unit Extraction (FUE)**

Dr. MunazaKulsum, Assistant Professor & Dr. Manjunath Hulmani ,Professor & HOD, Dr. Shreyas Kololgi, PG

Introduction:

In today's world, hair restoration has undergone a revolution, thanks to cutting-edge techniques like Follicular Unit Extraction (FUE). Hair loss is a common concern, affecting people's self-esteem. Fortunately, FUE has emerged as a game-changing solution. In this article, we'll explore how FUE is reshaping the world of hair transplant surgery.

Understanding Hair Loss:

Hair loss can stem from various causes – genetics, hormones, stress, and medical conditions. Regardless of the trigger, losing hair can be a distressing experience, prompting many to seek solutions.

The FUE Technique:

At the heart of this transformation is the innovative Follicular Unit Extraction (FUE) technique. FUE is a minimally invasive procedure that has gained immense popularity. Unlike traditional methods, FUE eliminates the need for a linear scalp incision. Instead, individual follicular units are extracted directly from the donor area using tiny punches, typically ranging from 0.8 to 1.0 mm in size.

This approach offers several advantages. First and foremost, it leaves no linear scars, making it an excellent choice for those who prefer shorter hairstyles. Additionally, the recovery time is significantly reduced, with many patients able to resume their daily activities within a few days.

Suitability for Hair Transplantation: Hair transplantation is a viable solution for a range of hair disorders. Understanding which conditions are suitable for transplantation is essential. Here's a summary of different types of alopecia and their suitability for hair transplantation

Suitable for Hair Transplantation: Male androgenetic alopecia, Female pattern hair loss, Secondary scarring alopecias (post-trauma, burns, post-radiotherapy, and post surgery), Temporal triangular alopecia, Advancement of frontal hairline in congenital high hairlines and traction alopecia, Eyebrow hair loss (excessive plucking, trauma, and post surgery), Eyelashes, beard, and pubic hair loss.

Not Suitable for Hair Transplantation:

Primary scarring alopecias (lichen planopilaris, frontal fibrosing alopecia, folliculitis decalvans, and discoid lupus), Alopecia areata, Vitiligo & Wounds (chronic).

Candidate Selection Criteria: The decision tree outlines the criteria for selecting ideal candidates for hair transplantation.

Encourage Medical Therapy: Before considering surgery, all patients should be encouraged to undergo medical therapy for maximum long-term density.

Stable Hair Loss with Desire for Greater Density: If medical therapy proves unsuccessful and the patient's hair loss is stable but they desire greater hair density, a hair transplant may be considered.

Patient Satisfaction with Stable Hair Loss: If the patient is happy with their current situation and the hair loss is stable, it is advisable to continue medical therapy and defer hair transplantation.
